

## IN THE CLAIMS

*Please cancel claims 23-31 as follows:*

1. (Previously Presented) In a mobile station, a method of automatically grouping user-specific information items comprising the acts of:

in response to a trigger signal, automatically grouping the user-specific information items by a processor of the mobile station by:

reading a first user-specific information item from a first file of the mobile station;

storing the first user-specific information item in a user information file or a message of the mobile station; and

repeating the acts of reading and storing for at least a second user-specific information item from a second file of the mobile station, so that the first and the second user-specific information items are grouped together as user information in the user information file or the message of the mobile station.

2. (Original) The method of claim 1, wherein each one of the first and the second user-specific information items comprises one of the following items: a user name associated with an end user of the mobile station; a telephone number of the mobile station; an e-mail address associated with an e-mail communication application of the mobile station; a Personal Identification Number (PIN) of the mobile station; and an address associated with the end user of the mobile station.

3. (Original) The method of claim 1, wherein the first user-specific information item comprises a Personal Identification Number (PIN) of the mobile station.

4. (Previously Presented) The method of claim 1, further comprising:

repeating the acts of reading and storing for at least a third user-specific information item from a third file of the mobile station, so that the first, the second, and the third user-specific information items are grouped together as user information in the user information file or the message.

5. (Original) The method of claim 4, wherein each one of the first, second, and third user-specific information items comprises one of the following items: a user name associated with an end user of the mobile station; a telephone number of the mobile station; an e-mail address associated with an e-mail communication application of the mobile station; a personal identification number (PIN) of the mobile station; and an address associated with the end user of the mobile station.

6. (Previously Presented) The method of claim 1, further comprising:

sending the user information file or the message from the mobile station to one or more recipients via a wireless communication network.

7. (Previously Presented) The method of claim 1, further comprising:

sending the user information file or the message through an e-mail communication to one or more recipients via a wireless communication network.

8. (Previously Presented) The method of claim 1, wherein the user information file or the message comprises the user information file and the method further comprises:

sending the user information file as an attachment to a message to one or more recipients via a wireless communication network.

9. (Previously Presented) The method of claim 1, wherein the trigger signal is based on an expiration of a timer.

10. (Previously Presented) The method of claim 1, wherein the trigger signal is produced in response to a user input request for the user information.

11. (Previously Presented) The method of claim 1, wherein the trigger signal is produced in response to an update to a user-specific information item.

12. (Previously Presented) A mobile station, comprising:  
a wireless transceiver;  
an antenna coupled to the wireless transceiver;  
a processor coupled to the wireless transceiver;  
memory;

the processor being adapted to automatically group user-specific information items by performing the following acts in response to a trigger signal:

- reading a first user-specific information item from a first file stored in the memory;

- storing the first user-specific information item in a user information file or a message; and

- repeating the reading and the storing for at least a second user-specific information item from a second file stored in the memory, so that the first and the second user-specific information items are grouped together as user information in the user information file or the message.

13. (Original) The mobile station of claim 12, wherein each one of the first and the second user-specific information items comprises one of the following items: a user name associated with an end user of the mobile station; a telephone number of the mobile station; an e-mail address associated with an e-mail communication application of the mobile station; a personal identification number (PIN) of the mobile station; and an address associated with the end user of the mobile station.

14. (Original) The method of claim 12, wherein the first user-specific information item comprises a Personal Identification Number (PIN) of the mobile station which is utilized for PIN messaging.

15. (Previously Presented) The mobile station of claim 12, wherein the processor is further operative to:

repeat the reading and the storing for at least a third user-specific information item from a third file stored in the memory, so that the first, the second, and the third user-specific information items are grouped together as user information in the user information file or the message.

16. (Original) The mobile station of claim 15, wherein each one of the first, second, and third user-specific information items comprises one of the following items: a user name associated with an end user of the mobile station; a telephone number of the mobile station; an e-mail address associated with an e-mail communication application of the mobile station; a personal identification number (PIN) of the mobile station; and an address associated with the end user of the mobile station.

17. (Previously Presented) The mobile station of claim 12, wherein the processor is further operative to:

cause the user information file or the message to be sent through the wireless transceiver to one or more recipients.

18. (Previously Presented) The mobile station of claim 12, wherein the processor is further operative to:

cause the user information file or the message to be sent by e-mail communication through the wireless transceiver to one or more recipients.

19. (Previously Presented) The mobile station of claim 12, wherein the trigger signal is produced in response to an expiration of a timer.

20. (Previously Presented) The mobile station of claim 12, wherein the trigger signal is produced in response to a user input request for the user information.

21. (Original) The mobile station of claim 12, wherein the first user-specific information item comprises an International Mobile Subscriber Identification (IMSI) and the memory comprises at least a Subscriber Identity Module (SIM) or Removable User Identity Module (R-UIM).

22. (Previously Presented) The mobile station of claim 12, wherein the trigger signal is responsive to an update to a user-specific information item.

23-31. (Canceled)
